

Concurrent Programming

Assignment Project Exam Help

15-213: Introduction

24rd Lecture, April 1 <https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Concurrent Programming is Hard!

- The human mind tends to be sequential
- The notion of time is often misleading
- Thinking about <https://eduassistpro.github.io/> of events in a computer system is at least a little and frequently impossible

Data Race

Add WeChat edu_assist_pro

Deadlock

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Deadlock

- Example from signal handlers.
- Why don't we use printf in handlers?

```
void catch_child(int signo) {
    printf("Child exited!\n"); // this call may reenter printf/puts! BAD! DEADLOCK!
    while (waitpid(
        ntinue; // reap all children
    )
}
```

■ Printf code:

- Acquire lock
- Do something
- Release lock

<https://eduassistpro.github.io/>

Deadlock

- Example from signal handlers.
- Why don't we use printf in handlers?

```
void catch_child(int signo) {
    printf("Child exited!\n"); // this call may reenter printf/puts! BAD! DEADLOCK!
    while (waitpid(
        ntinue; // reap all children
    )
}
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- **Printf code:**

- Acquire lock
- Do something
- Release lock

Add WeChat edu_assist_pro

Deadlocked!

- What if signal handler interrupts call to printf?

Testing Printf Deadlock

```

void catch_child(int signo) {
    printf("Child exited!\n"); // this call may reenter printf/puts! BAD! DEADLOCK!
    while (waitpid(-1, NULL, WNOHANG) > 0) continue; // reap all children
}

int main(int argc, char** argv) {
    ...
    for (i = 0; i < 10
        if (fork() == 0)
            // in child, e
            exit(0);
        }
        // in parent
        sprintf(buf, "Child #%d started\n", i);
        printf("%s", buf);
    }
    return 0;
}

```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

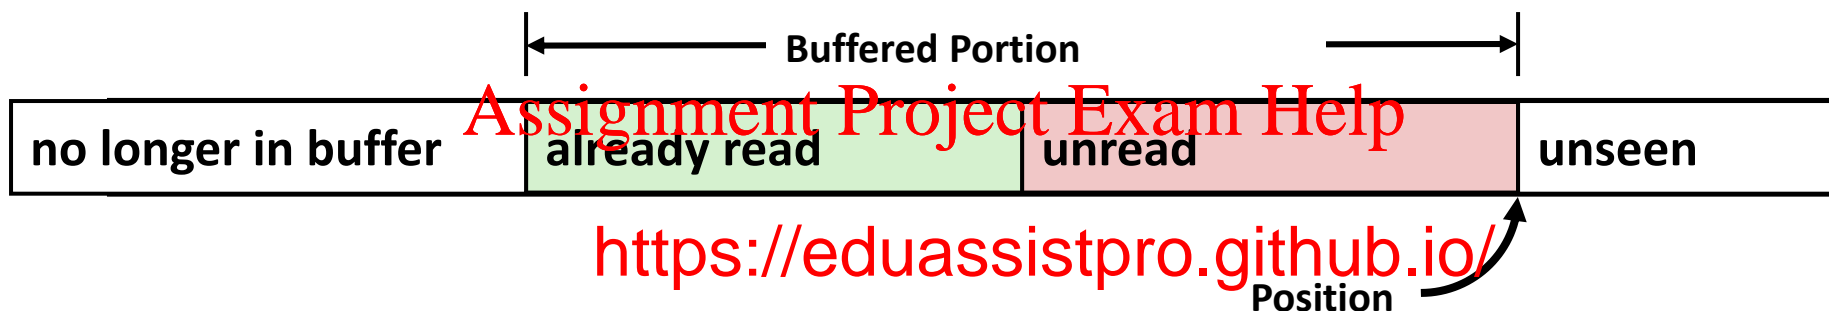

```

Child #0 started
Child #1 started
Child #2 started
Child #3 started
Child #4 started
Child #5 started
.
.
.
Child #5888 started
Child #5889 started

```

Why Does Printf require Locks?

- Printf (and fprintf, sprintf) implement *buffered* I/O

Add WeChat edu_assist_pro

Wait for server
to finish with
Client 1

Where Does Second Client Block?

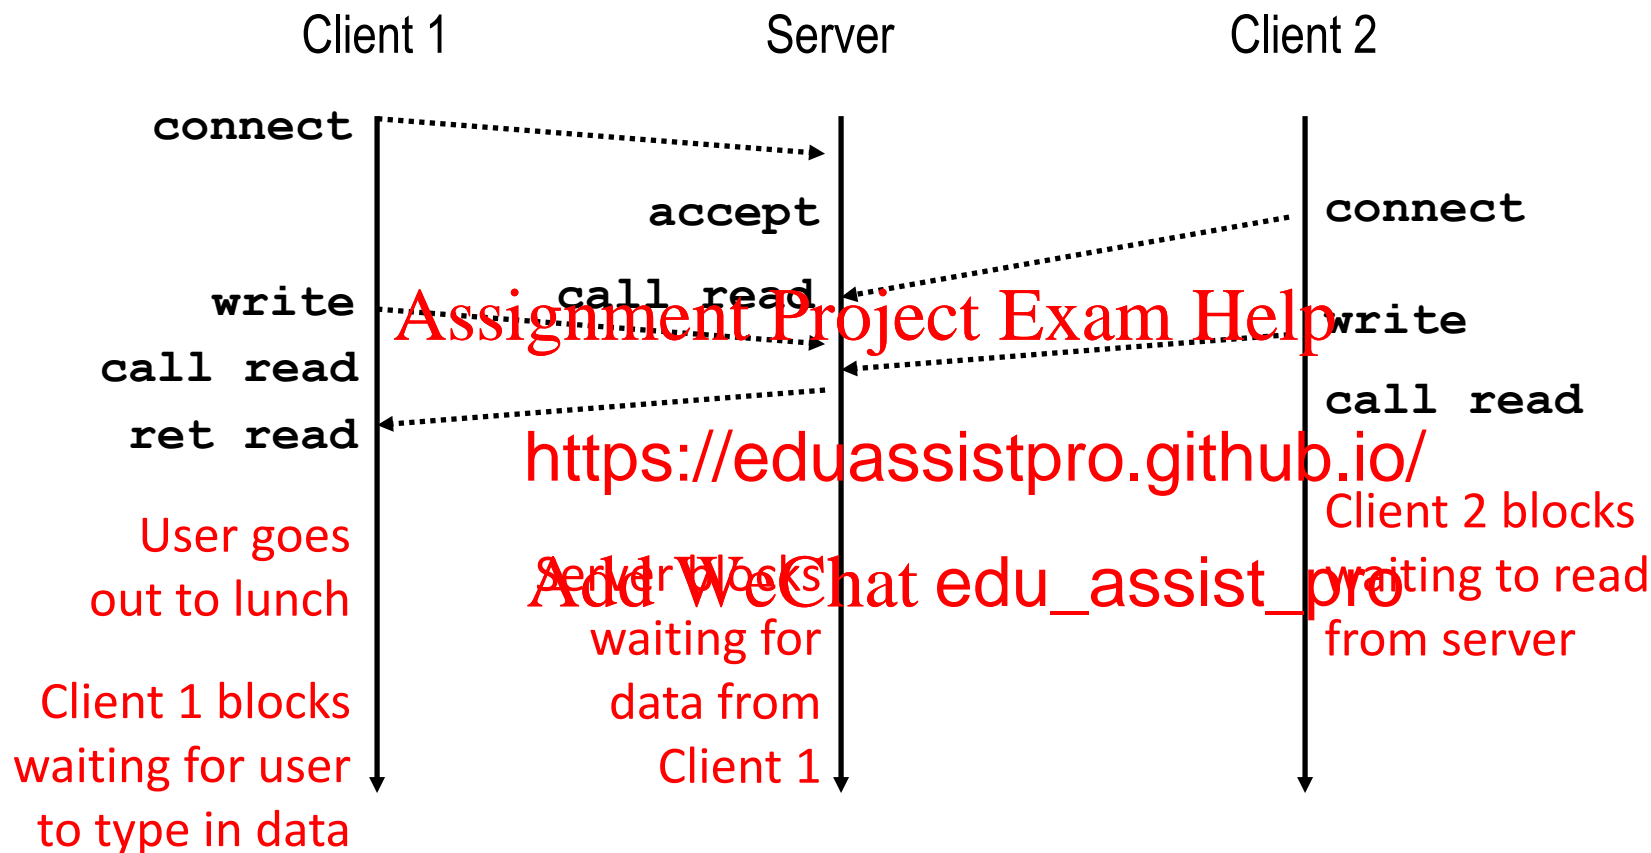

- Second client attempts to connect to iterative server

- Call to connect returns

- Even though connection not yet accepted

Fundamental Flaw of Iterative Servers

■ Solution: use **concurrent servers** instead

- Concurrent servers use multiple concurrent flows to serve multiple clients at the same time

Approaches for Writing Concurrent Servers

Allow server to handle multiple clients concurrently

1. Process-based

- Kernel automatically interleaves multiple logical flows
- Each flow has its own address space

2. Event-based

- Programmer manually interleaves logical flows
- All flows share the same address space
- Uses technique called *I/O multiplexing*

3. Thread-based

- Kernel automatically interleaves multiple logical flows
- Each flow shares the same address space
- Hybrid of process-based and event-based

Add WeChat edu_assist_pro

- Reap all zombie children

Concurrent Server: `accept` Illustrated

1. Server blocks in `accept`, waiting for connection request on listening descriptor `listenfd`

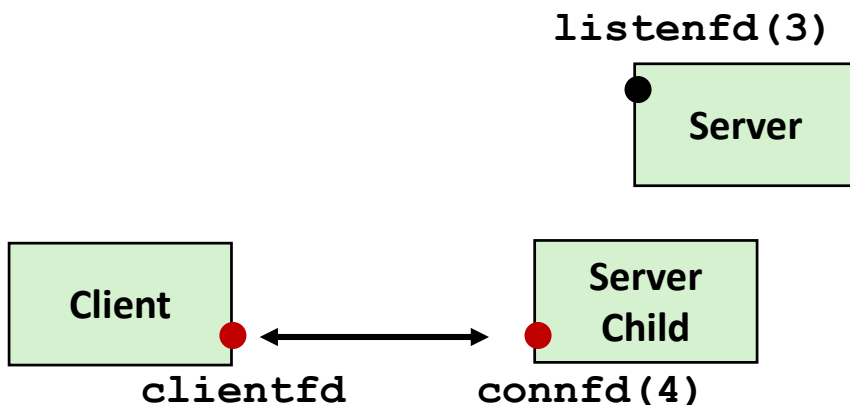

Assignment Project Exam Help

<https://eduassistpro.github.io/>

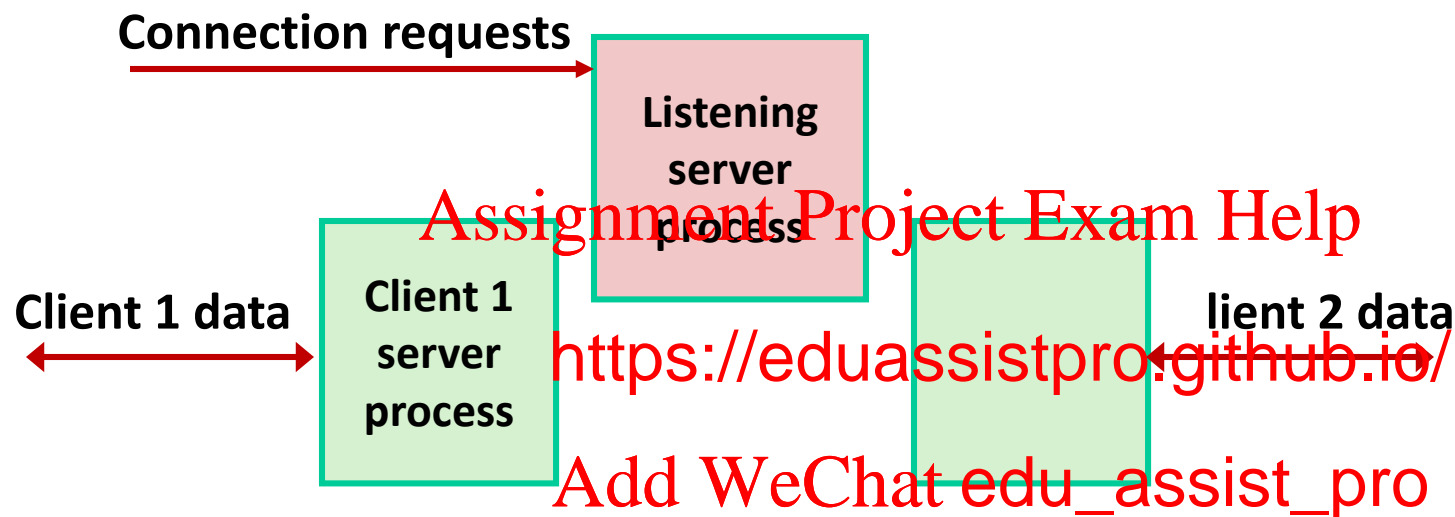

Add WeChat edu_assist_pro

makes connection calling `connect`

3. Server returns `connfd` from `accept`. Forks child to handle client. Connection is now established between `clientfd` and `connfd`

Process-based Server Execution Model

- Each client handled by independent child process
- No shared state between them
- Both parent & child have copies of `listenfd` and `connfd`
 - Parent must close `connfd`
 - Child should close `listenfd`

Issues with Process-based Servers

■ Listening server process must reap zombie children

- to avoid fatal memory leak

■ Parent process must close its copy of connfd

- Kernel keeps reference count for each socket/open file

- After fork, re

- Connection wil

<https://eduassistpro.github.io/>

t connfd) = 0

Add WeChat edu_assist_pro

```

int main(int argc, char **argv)
{
    int listenfd, connfd;
    socklen_t clientlen;
    struct sockaddr_storage clientaddr;

    listenfd = Open_listenfd(1);
    while (1) {
        clientlen = sizeof(struct sockaddr_storage);
        connfd = Accept(listenfd, &clientaddr, &clientlen);
        if (Fork() == 0) {
            echo(connfd);
            Close(connfd);
            exit(0);
        }
    }
}

```

Pros and Cons of Process-based Servers

- **+ Handle multiple connections concurrently**
- **+ Clean sharing model**
 - descriptors (no)
 - file tables (yes)
 - global variables
- **+ Simple and straightforward**
- **– Additional overhead for process control**
- **– Nontrivial to share data between processes**
 - (This example too simple to demonstrate)

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Approach #2: Event-based Servers

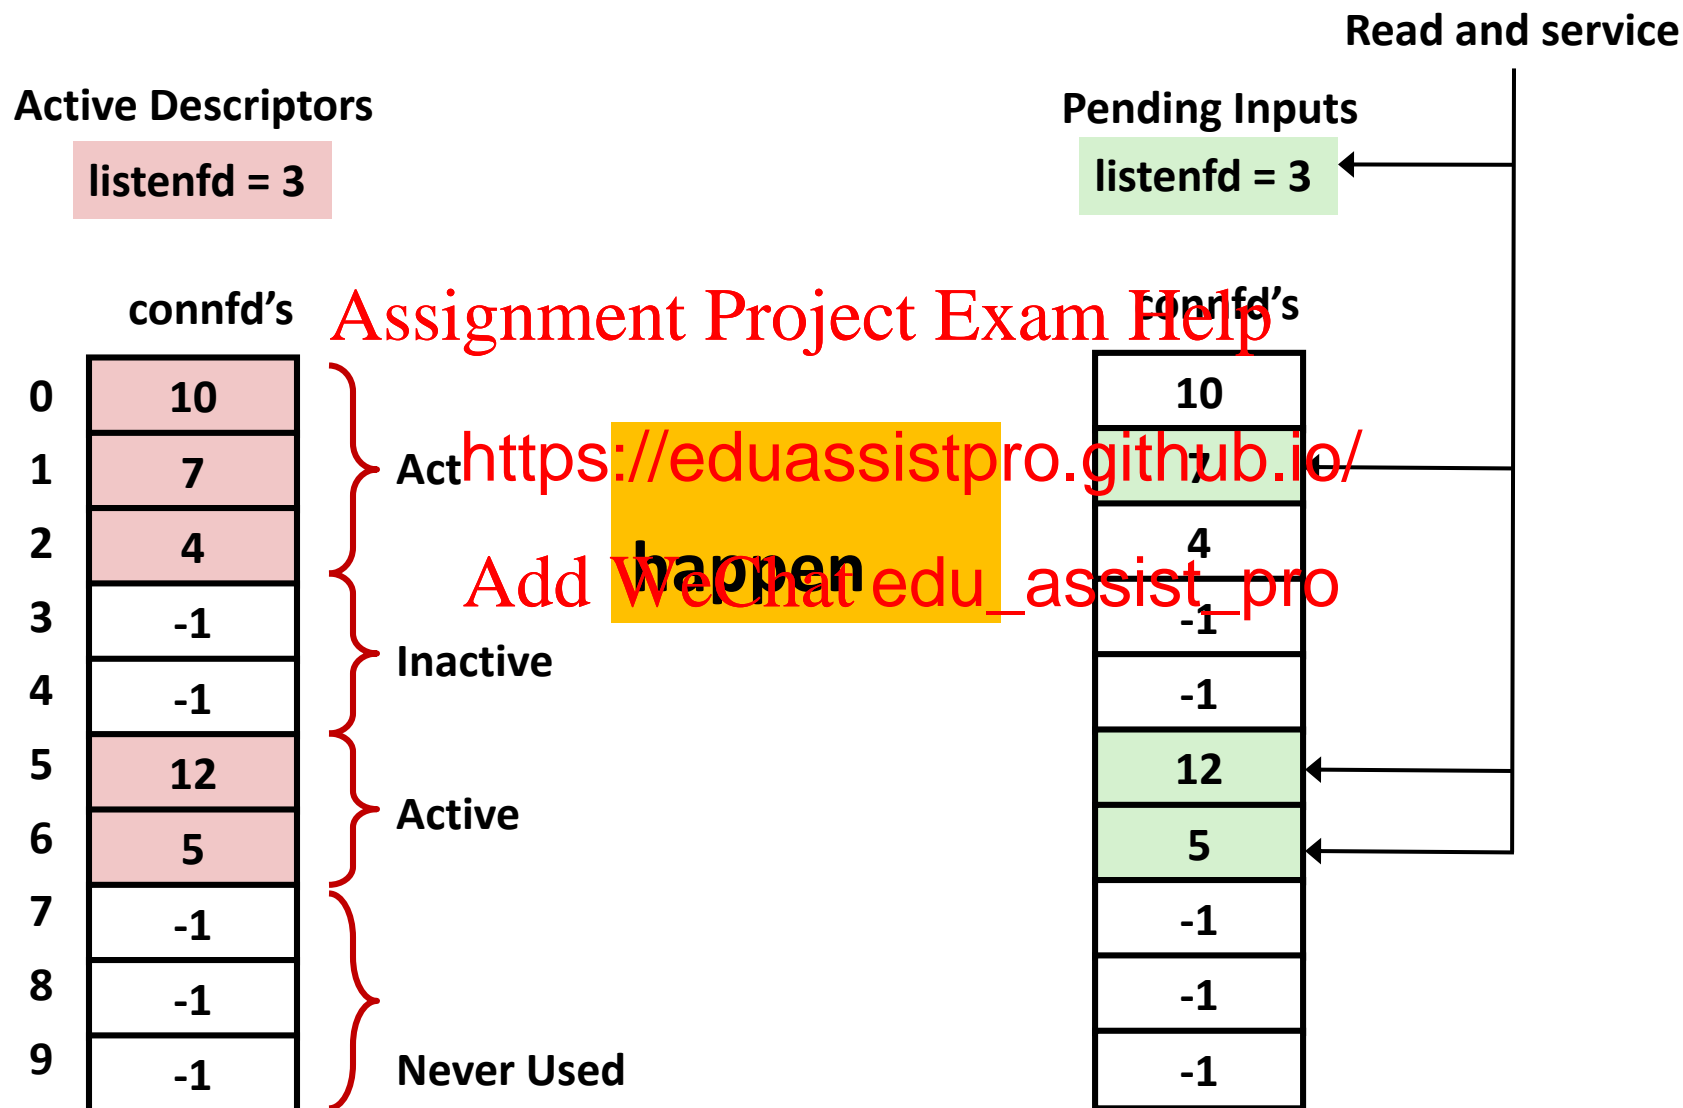

- **Server maintains set of active connections**
 - Array of `connfd`'s
- **Repeat:**
 - Determine which `tenfd` have pending inputs
 - e.g., using `select` function
 - arrival of pending input is an event
 - If `listenfd` has input, then `accept` connection
 - and add new `connfd` to array
 - Service all `connfd`'s with pending inputs
- **Details for select-based server in book**

Add WeChat edu_assist_pro

I/O Multiplexed Event Processing

Pros and Cons of Event-based Servers

- + One logical control flow and address space.
- + Can single-step with a debugger.
- + No process or thread control overhead.
 - Design of choice for high-performance web servers and search engines. e.g., Node.js, ngi
- – Significantly more complex to process- or thread-based designs.
- – Hard to provide fine-grained concurrency
 - E.g., how to deal with partial HTTP request headers
- – Cannot take advantage of multi-core
 - Single thread of control

Approach #3: Thread-based Servers

- **Very similar to approach #1 (process-based)**
 - ...but using threads instead of processes

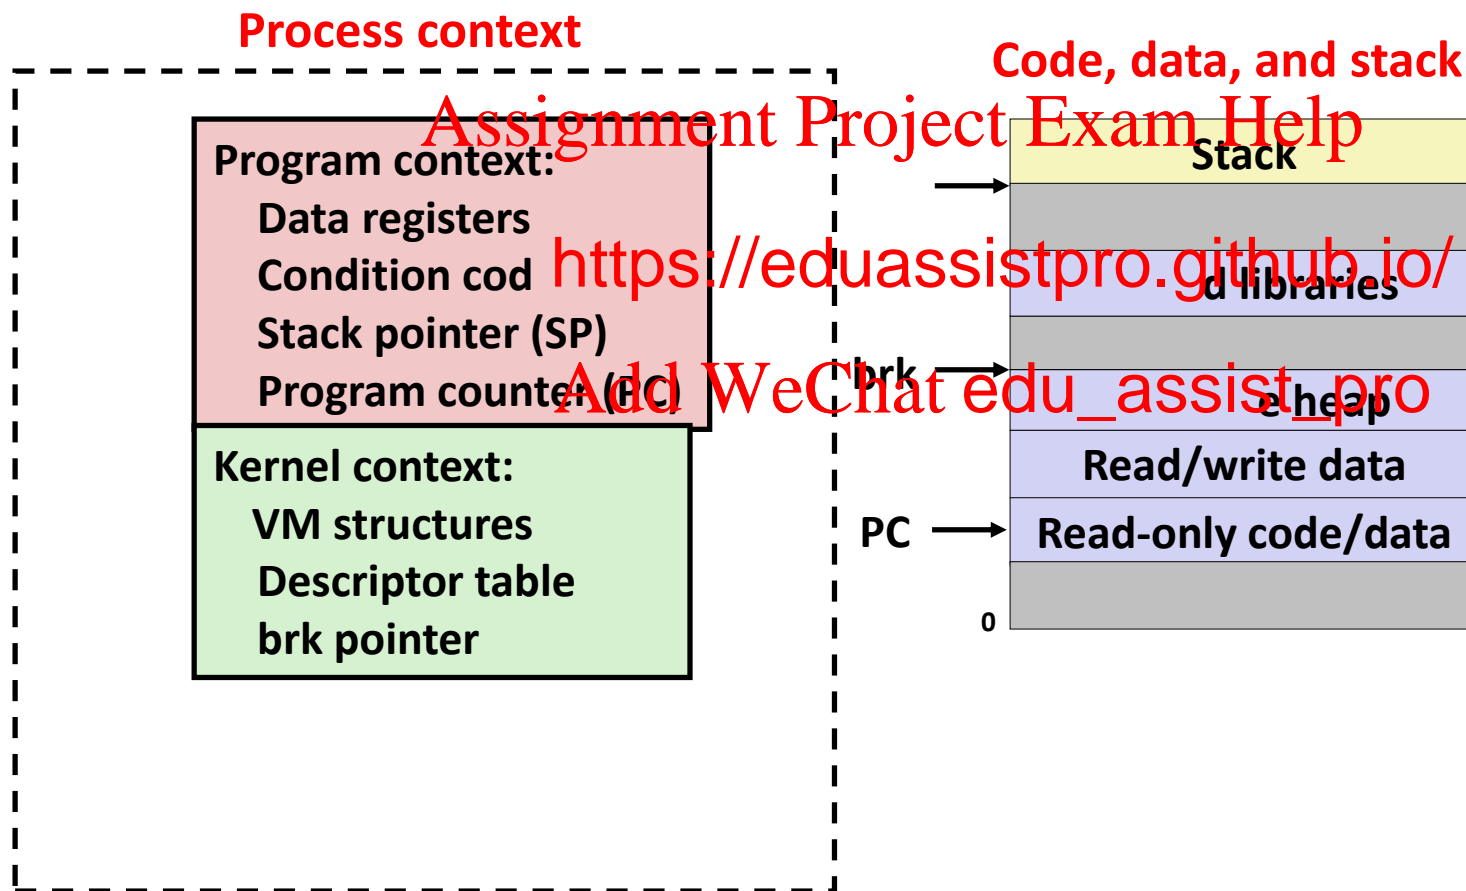

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

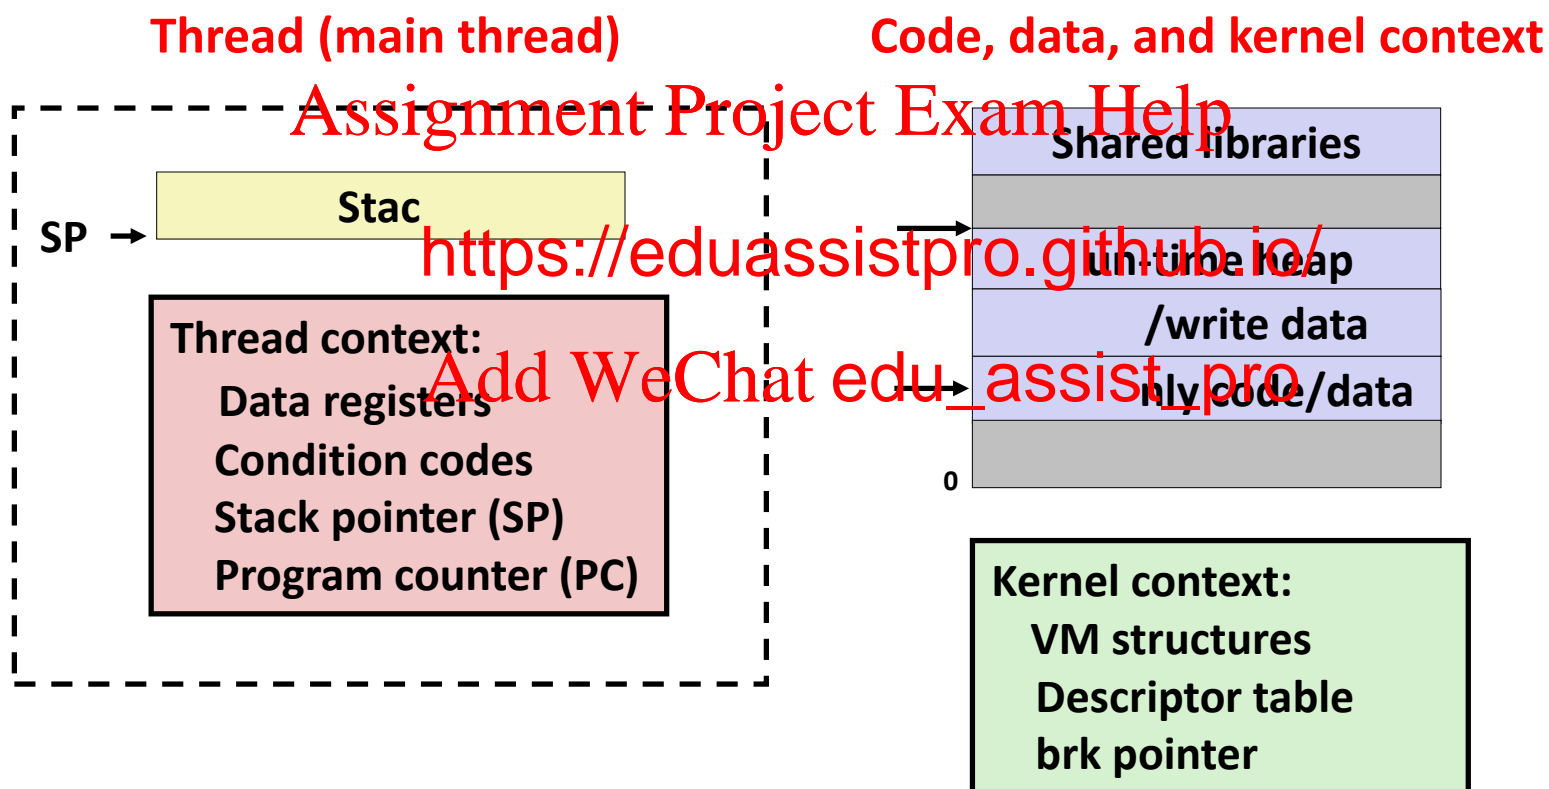

Traditional View of a Process

- Process = process context + code, data, and stack

Alternate View of a Process

- Process = thread + code, data, and kernel context

A Process With Multiple Threads

- **Multiple threads can be associated with a process**
 - Each thread has its own logical control flow
 - Each thread shares the same code, data, and kernel context
 - Each thread has its own stack for local variables
 - but not protected from other threads
 - Each thread has its own thread id (TID)

Assignment Project Exam Help

Thread 1 (main thread) <https://eduassistpro.github.io/> shared code and data

Add WeChat edu_assist_pro

stack 1

stack 2

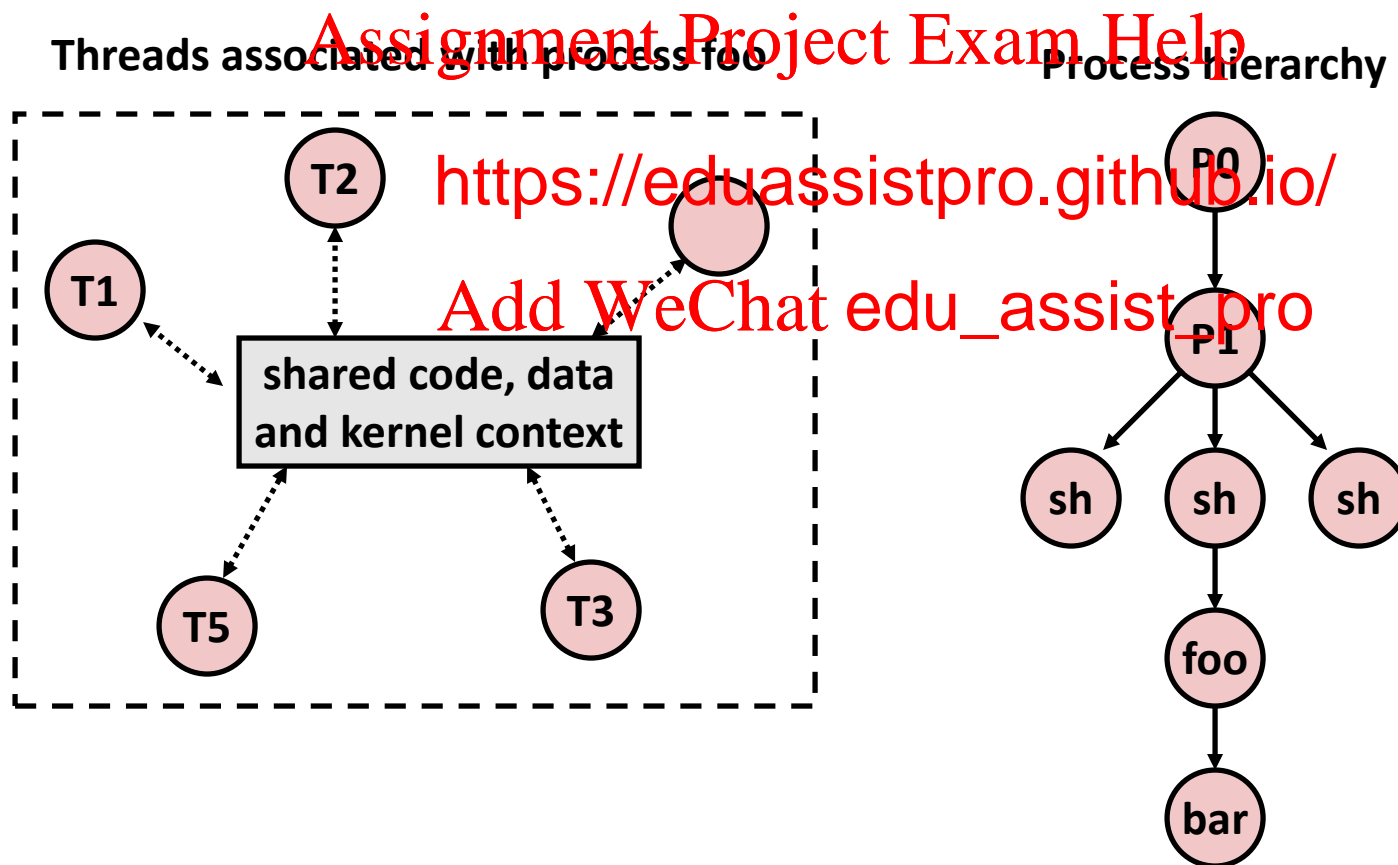

Thread 1 context:
 Data registers
 Condition codes
 SP_1
 PC_1

Thread 2 context:
 Data registers
 Condition codes
 SP_2
 PC_2

Logical View of Threads

- **Threads associated with process form a pool of peers**
 - Unlike processes which form a tree hierarchy

Concurrent Threads

- Two threads are *concurrent* if their flows overlap in time
- Otherwise, they are sequential

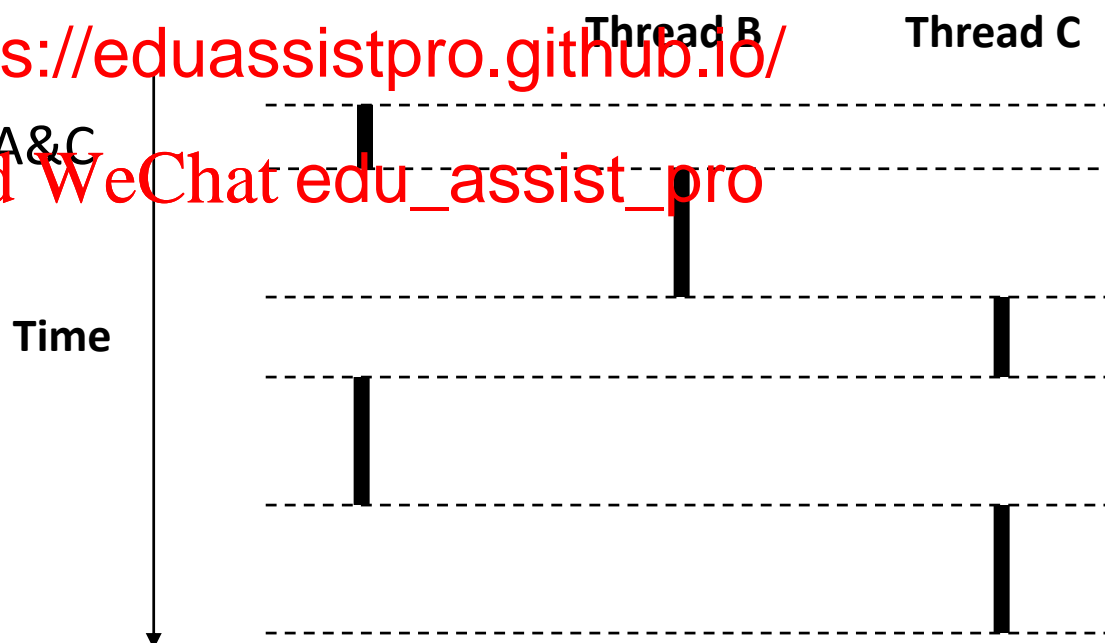

Assignment Project Exam Help

- **Examples:**

- Concurrent: A & B, A&C
- Sequential: B & C

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Concurrent Thread Execution

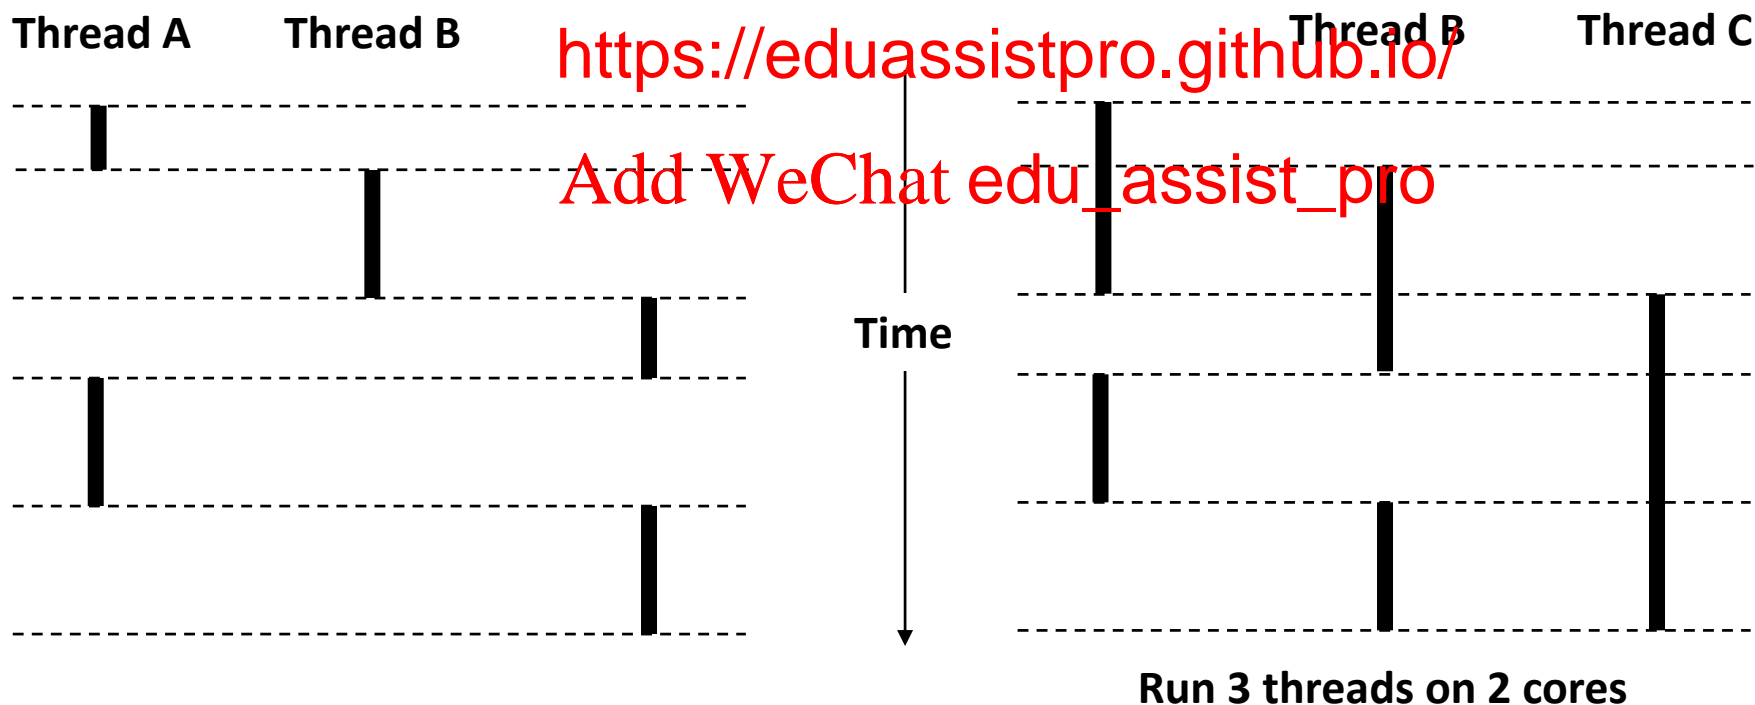

■ Single Core Processor

- Simulate parallelism by time slicing

■ Multi-Core Processor

- Can have true parallelism

Assignment Project Exam Help

Threads vs. Processes

■ How threads and processes are similar

- Each has its own logical control flow
- Each can run concurrently with others (possibly on different cores)
- Each is context switched

■ How threads and processes differ

- Threads share a global address space (separate user and kernel stacks)
 - Processes (typically) do not
- Threads are somewhat less expensive than processes
 - Process control (creating and reaping) twice as expensive as thread control
 - Linux numbers:
 - ~20K cycles to create and reap a process
 - ~10K cycles (or less) to create and reap a thread

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Threads vs. Signals

Assignment Project Exam Help

- **Signal handler s** <https://eduassistpro.github.io/>
 - Including stack
- **Signal handler interrupts nor** **execution**
 - Unexpected procedure call
 - Returns to regular execution stream
 - *Not* a peer
- **Limited forms of synchronization**
 - Main program can block / unblock signals
 - Main program can pause for signal

Add WeChat edu_assist_pro

Posix Threads (Pthreads) Interface

- **Pthreads:** Standard interface for ~60 functions that manipulate threads from C programs
 - Creating and reaping threads
 - `pthread_create()`
 - `pthread_join()`
 - Determining your thread ID
 - `pthread_self()`
 - Terminating threads
 - `pthread_cancel()`
 - `pthread_exit()`
 - `exit()` [terminates all threads]
 - `return` [terminates current thread]
 - Synchronizing access to shared variables
 - `pthread_mutex_init`
 - `pthread_mutex_[un]lock`

/* Thread routine */  
void *thread(void *vargp)  
{  
    int connfd = *((int *)vargp);  
    Pthread_detach(pthread_self());  
    Free(vargp);  
    echo(connfd);  
    Close(connfd);  
    return NULL;  
}
```

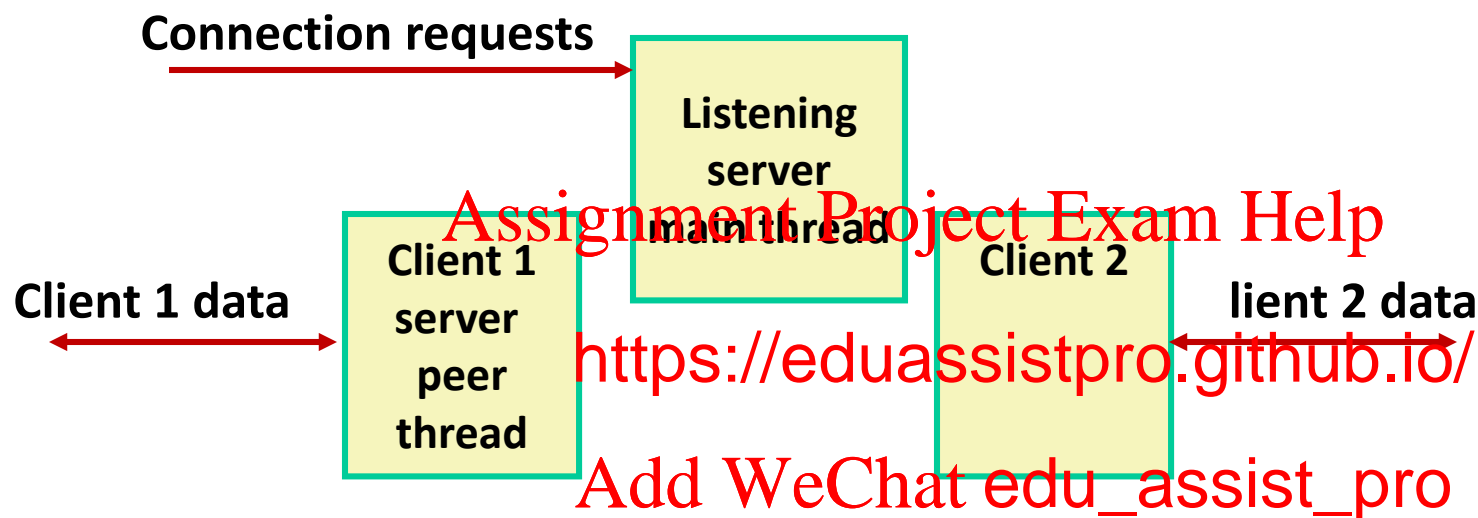

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- Run thread in “detached” mode.
 - Runs independently of other threads
 - Reaped automatically (by kernel) when it terminates
- Free storage allocated to hold **connfd**
- Close **connfd** (important!)

Thread-based Server Execution Model

- Each client handled by individual peer thread
- Threads share all process state except TID
- Each thread has a separate stack for local variables

Issues With Thread-Based Servers

■ Must run “detached” to avoid memory leak

- At any point in time, a thread is either *joinable* or *detached*
- *Joinable* thread can be reaped and killed by other threads
 - must be reaped (with `pthread_join`) to free memory resources
- *Detached* thread can be reaped by other threads
 - resources are freed automatically
- Default state is joinable
 - use `pthread_detach(pthread_t)` to make detached

■ Must be careful to avoid unintended sharing

- For example, passing pointer to main thread's stack
 - `Pthread_create(&tid, NULL, thread, (void *)&connfd);`

■ All functions called by a thread must be *thread-safe*

- (next lecture)

■ Producer-Consumer Model

- Allocate in main
- Free in thread routine

Pros and Cons of Thread-Based Designs

- **+ Easy to share data structures between threads**
 - e.g., logging information, file cache
- **+ Threads are more efficient than processes**
- **– Unintentional subtle and hard-to-reproduce errors**
 - The ease with which data can be shared is the greatest strength and the greatest weakness of threads
 - Hard to know which data shared & which private
 - Hard to detect by testing
 - Probability of bad race outcome very low
 - But nonzero!
 - Future lectures

Summary: Approaches to Concurrency

■ Process-based

- Hard to share resources: Easy to avoid unintended sharing
- High overhead in adding/removing clients

■ Event-based

- Tedious and low level
- Total control over execution
- Very low overhead
- Cannot create as fine grained a concurrency
- Does not make use of multi-core

■ Thread-based

- Easy to share resources: Perhaps too easy
- Medium overhead
- Not much control over scheduling policies
- Difficult to debug
 - Event orderings not repeatable
